### **Action Method Execution**

Alex Wolf
www.alexwolfthoughts.com

## The MVC Request Life Cycle

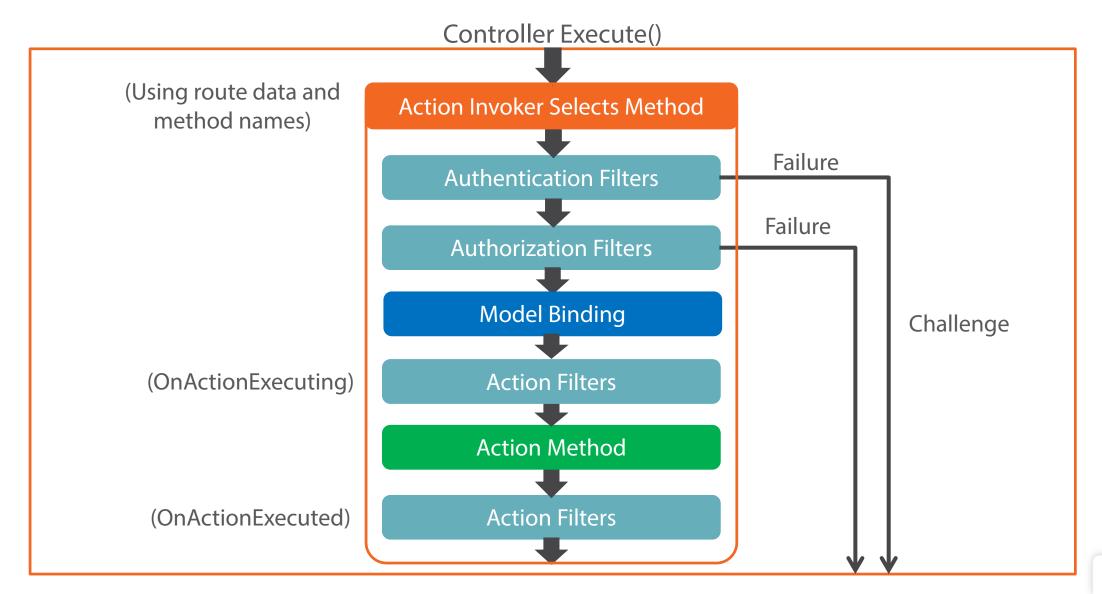

#### Module Outline

- Action Methods and the Life Cycle
- Understanding the Action Invoker
- Making decisions with Action Selectors
- Influencing the request with Filters
- The Model Binding process

#### The Action Method Execution Process

#### The Action Invoker

#### The IActionInvoker Interface

```
public interface IActionInvoker()
{
    bool InvokeAction(ControllerContext controllerContext, string actionName);
}
```

- MVC Framework provides the powerful ControllerActionInvoker
- Can customize default behavior using extension points

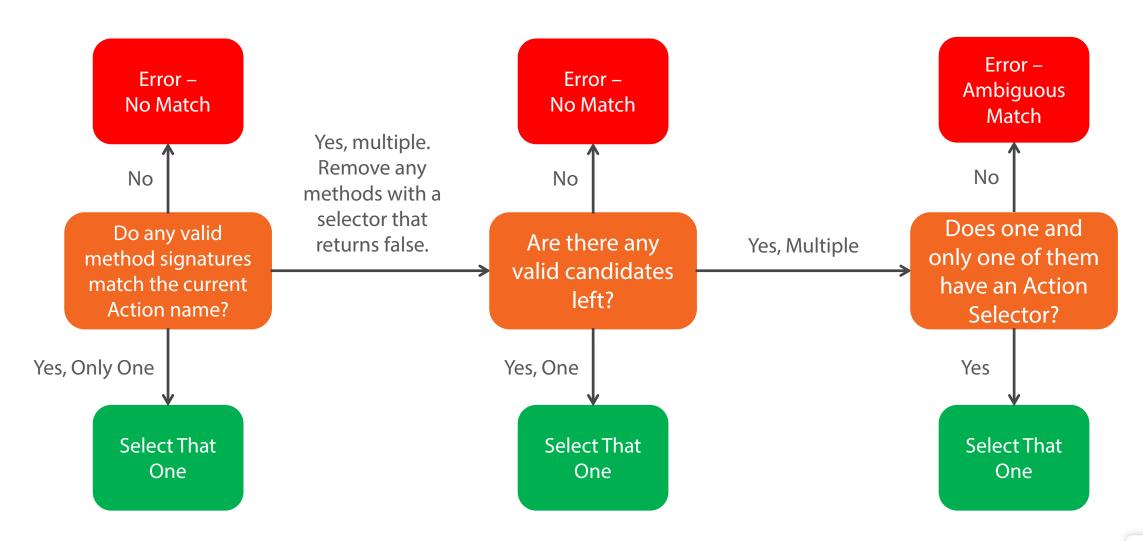

#### **Action Method Selectors**

#### Common Action Selectors

[AcceptVerbs] [HttpGet] [HttpPost] [NonAction] [ActionName] [Custom]

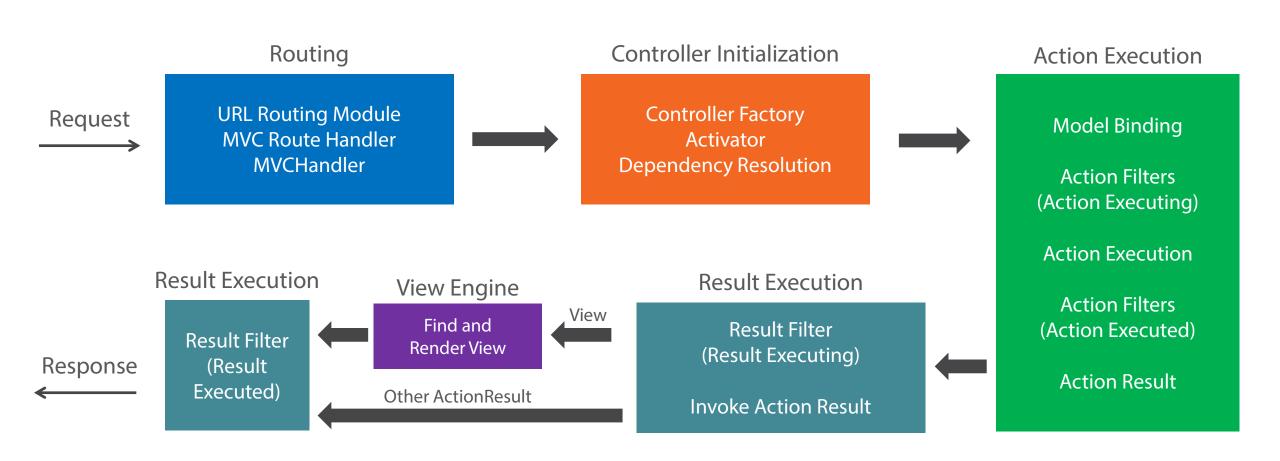

## Selecting an Action Method

## Working with Action Selectors

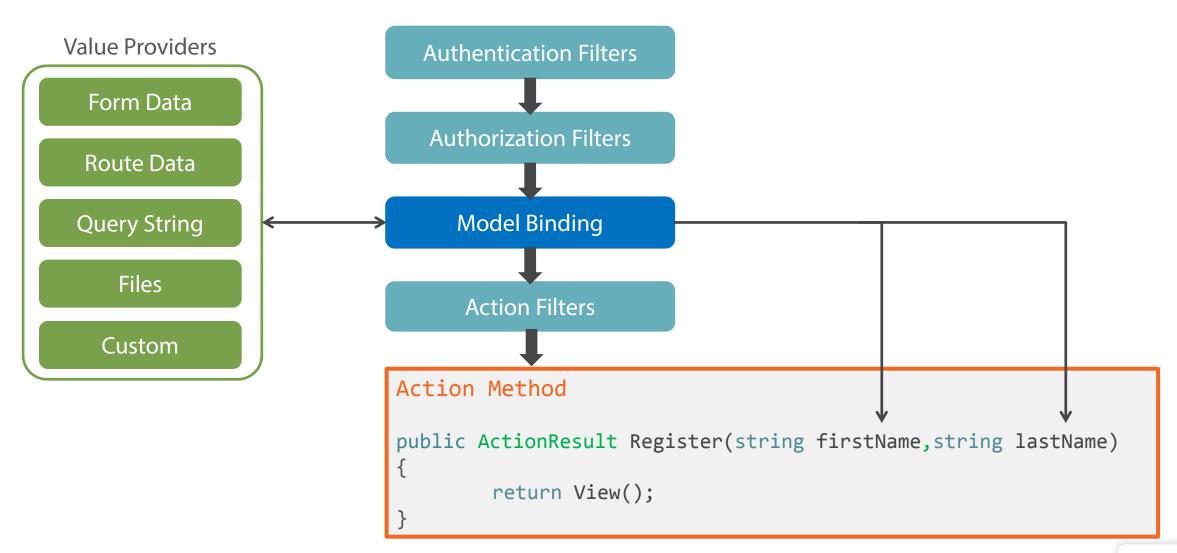

```
[HttpGet]
public ActionResult Register()
{
         return View();
}
[HttpPost]
public ActionResult Register(RegistrationInfo personalInfo)
{
         return View(personalInfo);
}
```

## Influencing the MVC Request Life Cycle

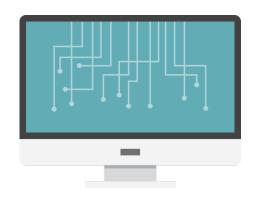

## Creating Custom Action Selectors

## The Model Binding Process

#### The IModelBinder Interface

## **Understanding Filters**

(In the context of the MVC Life Cycle)

# Filter Types

## Understanding Filter Scope

#### Action Method Scope

Filter

Action Method

Filter

Filter Action Method

Filter

Controller Scope

Filter

Filter

Global Scope

#### The Filter Execution Process

## Summary

- Controller uses the Action Invoker to find and execute Action Methods
- Invoker selects a method based on name and Action Selectors
- Filters can inject security logic and other custom code
- Model Binder populates Action Method parameters for the Action Invoker
